DETAILED ACTION

Allowable Subject Matter

1. Claims 1-7, 9 and 10 allowed
2. Claims 15 and 21 objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 11-14 and 16-20 rejected under 35 U.S.C. 103(a) as being unpatentable over Arase (JP 04069939) in view of Williams (5,998,837).

Regarding Claims 11-14 and 16-20, Arase discloses field effect transistor of insulating gate type where in Figl. 1, an N+ type diffusion region 13 is disclose in the P-type substrate 11 with P+ type polysilicon plug 17a is located on top of the N+ type diffusion region and a wiring layer 18 is located on top of the P+ type polysilicon plug 17a.

Futhermore, N+ type diffusion region 13 extends on the surface of the P-type substrate 11 and P+ type polysilicon plug extends from the surface of the substrate. Region 17a and 13 form a PN junction. Wiring layer 18 a is directly on top of the polysilicon plug 17a. Arase fails to disclose the required doping densities. However, Williams discloses a

Art Unit: 2826

trench-gated power MOSFET with protective diode having adjustable breakdown voltage where in Claim 14 the required doping density is disclosed.

It would have been obvious to one of having ordinary skill in the art at the time the invention was made to include the required doping density in Arase as taught by Williams in order to have a semiconductor device with increase reliability.
